

## ABSTRACT OF THE INVENTION

A wire is obtained by winding a conductor on a center core obtained by twisting a plurality of core threads, and the surface of the 5 conductor is covered with an insulator. As the conductor, a rectangular wire having a rectangular section is preferably used rather than a round wire with respect to volume occupation. The plurality of wires, e.g., three wires, constitute a wire rod. These three wires are twisted, woven, or bundled to form a wire rod. Three wire rods are twisted, woven, or 10 bundled to form an electric cord. A loudspeaker uses the electric cord, and the electric cord is used as a signal input line for a voice coil.
